

Microservice Architecture – Task 5

Link to GitHub

https://github.com/Romko-studik/micro_basics/tree/micro_consul

Architecture

The system includes three services:

- **facade-service:** Handles POST/GET HTTP requests from the client
- **logging-service:** Stores messages with deduplication and retry support
- **messages-service:** Stores messages via queue and is able to return

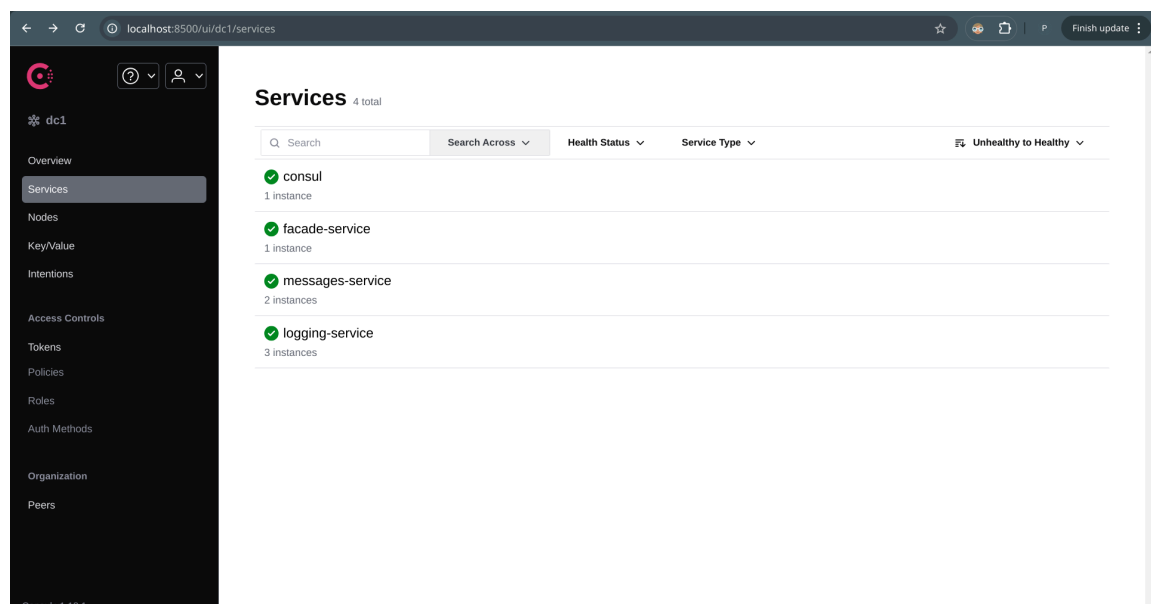

Running the Services

Run in separate terminals:

```
./start_services.sh
```

Tests:

When we start all of the services we can open consul and see this:

When we turn off some of the services (To do this I had to change start_services.sh a bit) we see this:

facade-service 1 instance
messages-service 2 instances
consul 1 instance
logging-service 3 instances

This means that health checks work correctly.
